

# WATERWIZER

## Why Use it?

**In times of drought, the WATERWIZER will help you save your landscaping. In non-drought conditions, it will save you money!**

The WATERWIZER was invented by a certified arborist with over 30 years of experience in the landscape and nursery industries.

Trees and shrubs need adequate water to maintain their health. When they are not adequately irrigated, they experience a great deal of environmental stress, leading to vulnerability to disease and insects. The weakened plants may die from the effects of the drought, and become a fire and wind hazard to boot.

If removed from the landscape, it is possible that the absence of these plants and shrubs may require increased heating and cooling in a home due to the lack of the protective vegetation.

Use the WATERWIZER to replace, or supplement the irrigation of your landscape to protect your valuable investment.

# WATERWIZER

## How it Works

**The average upright washer uses 30-60 gallons of water per load - save the good water for your irrigation!**

Drain water from the washing machine goes to the **WATERWIZER**, where the quality of the water is checked by an electronic sensor system. If concentrations of chemicals exceed a user set limit, the “tainted” water is directed down the drain.

When the **WATERWIZER** detects that the washer water quality is acceptable, the “good” water is directed by solenoid valves to the surge tank storage system. An air gap is used at the drain going into the tank to prevent the washer from siphoning to the tank, or vice versa.

The washer pump is not designed for pressure, so do not expect to run your irrigation system from the washer pump. You can, however, run your irrigation via a gravity system from the tank or you can easily install a pump on the tank outlet.

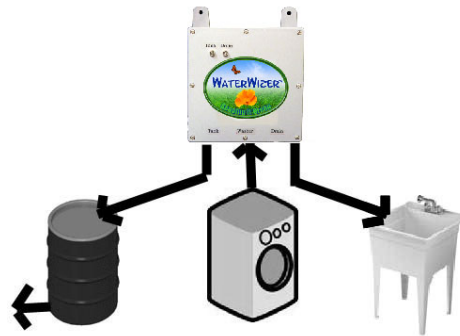

The **WATERWIZER** will monitor your drain water and recycle water that would normally go down the drain, making it available for watering your landscape, vegetable garden, trees, or fire break. Check with your local agencies to find out the best way to distribute your grey water.

Installation is so easy, anyone can do it! The only tool needed to install the

**WATERWIZER** Is a screwdriver!.

See the installation video at:

[www.waterwizer.com](http://www.waterwizer.com)

**WATERWIZER**

**BASIC PACKAGE - \$299.00**

The **WaterWizer** Controller Box (purchaser supplies all necessary parts for operation)

*Controller can be used with existing grey water systems*

## WATERWIZER

**DELUXE PACKAGE - \$399.00**

The Controller box plus float switch & connectors, hoses, clamps, 4 hose lint pre filters for the tank fill hose, along with all necessary hardware to install as seen in installation video (purchaser supplies tank)

## WATERWIZER

**ULTIMATE PACKAGE - \$799.00**

The Deluxe package; pedestal, tank with all the fittings, filter, extra cartridge and all necessary fittings for a point of connection to the user supplied grey water drip system.

*This system meets all the requirements for a permit free system under current California state statutes.*
